

## ABSTRACT OF THE DISCLOSURE

A system and method for managing state information between processes in different domains, and, more particularly, to software, systems and methods for  
5 determining and updating state information using hypertext transfer protocol (HTTP) cookies. A state management server manages priority information based on the priority of content requested by a user agent from a number of different domains. In a preferred embodiment, domain-  
10 specific state information is collected by a plurality of front-ends operating in dynamically assigned domains, and reported to the state management server which operates in a statically assigned domain. Preferably, the state management server causes the global priority information  
15 to be stored on a client device, such as a computer, in the form of a global cookie.
